

VULNERABILITY MANAGEMENT PORTFOLIO LAB

Final Technical Report - Portfolio Copy

Scope: isolated VMware lab using Greenbone Vulnerability Management (GVM/OpenVAS).

Assets: 192.168.100.128 DVWA, 192.168.100.129 Windows 11,
192.168.100.131 Ubuntu. 192.168.100.132 is the management host.

Workflow

Asset inventory -> baseline scan -> validation -> remediation -> authenticated verification
-> final scan

Primary outcome

DVWA displayed findings: 40 baseline -> 28 final.

Change: -12 displayed findings, a 30% reduction.

This is a scan-count comparison, not a universal security score.

Authenticated verification

Ubuntu final authenticated scan: 0 displayed findings.

Windows final authenticated scan: 0 displayed findings.

Residual risk

The legacy DVWA host remains on an end-of-life Ubuntu 10.04 platform.

Legacy TLS/OpenSSL, SSH algorithms, certificates, cookies, web/application weaknesses,
cleartext authentication transport and FTP exposure remain relevant.

Selected remediation

Disabled server-status and server-info exposure.

Blocked Subversion metadata paths.

Applied partial TLS hardening on the legacy Apache/XAMPP stack.

Ubuntu: disabled TCP timestamps, removed weak SSH MACs, blocked ICMP timestamp requests.

Windows: disabled RFC 1323 TCP timestamps.
